

Insulated manifolds FLEXY BOX PRO P

Highest quality galvanised steel
275 g/m³

Indentations and blockages

Mounting brackets

Self-sealing connectors

Inner insulation
10 mm

Opening revision

Perforated plate

Connector with a gasket

Description

The **FLEXY BOX PRO P** is the connection element of the **FLEXY DUCT** flexible ducts. Together they create a complete air distribution solution in mechanical ventilation.

Design

The box is made of galvanised steel, with internal insulation of 10 mm thick rubber mat. A perforated plate is placed inside the box for even air distribution and the removable cover acts as an inspection hatch. Thanks to the large number of pressed connections, the box is characterised by high tightness. Self-sealing connectors, made of high quality rubber with an additional structural built-in gasket, allow for a very fast and tight fitting of **FLEXY DUCT** ducts. On individual request, it is possible to make a stainless steel box.

Usage

The **FLEXY BOX PRO P** junction box allows the main supply and exhaust sequences to be separated into an appropriate number of **FLEXY DUCT** ducts. Using **FLEXY END** plugs, you can easily adjust the number of working connectors to the needs of the installation.

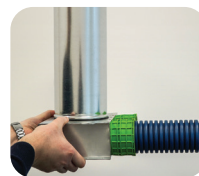

Exceptionally fast and easy installation without tools!

1. Inset the ventilation duct HAVACO FLEXY DUCT into a connector

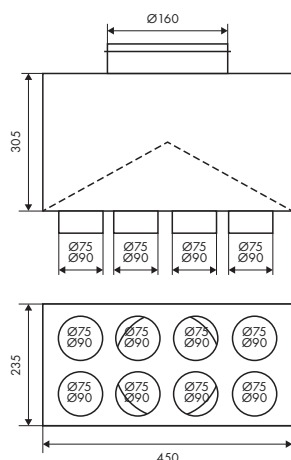

2. Press until you hear a click.

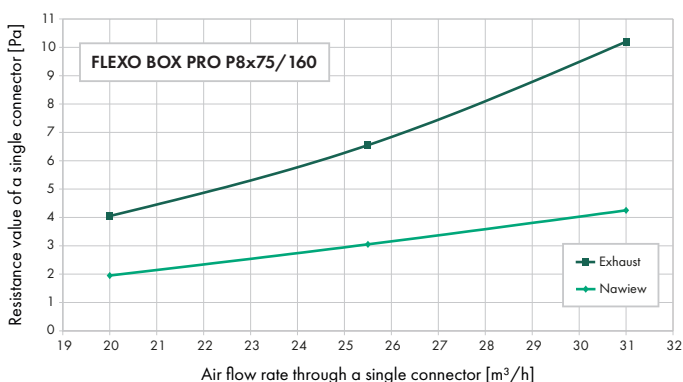

3. DONE - you have installed the duct in the box! And the whole thing is in the C tightness class!
